Subject: Low Power FM

Commissioner, I urge you to accept a practical application for low power FM broadcasting. As the huge radio conglomerates continue their Sherman like march through the industry, there will soon be no possibility for broadcasters like myself who had hoped to one day own a local radio station. I currently work in a small market station yet from scanning the dial, I know there are a number of frequencies where a 100 watt or less station would not interfere with the station I work for or any of the other stations with even 2 contour signal in this market. For all the NAB's hollering, the fact remains that it's more hot air than facts that they offer as a counter to the current proposals. there may be markets where interference would occur no matter what dial position were used for low power radio but in most markets, it just will not be a problem. Thanks you for your time and consideration of my statements.
