

The idea of a locally operated, low power FM station, is long overdue. Those of us that live in rural communities with limited, if any, locally oriented programming would certainly welcome such a change in the rules. There also seems to be enough suppliers of FM transmitters that the start up process would be financially bearable. Don't do anything in the rules that would require specialized transmitting equipment or you will defeat the whole idea. The people who will be most interested in this service, are not the big money guys that already dominate the majority of the airwaves. Even better is the idea that no owner of an existing regular radio station could own not even one any percent of a low power fm station!
