

I am in favor of a low power FM service. I think the criteria for determining power levels should be based on the fact that current licensing demands a 100 watt minimum. It has been noted in various articles in "Radio World" that pirate stations running 95 watts ERP have gotten rather good coverage. Therefore, I believe some compromise between the two sides of the issue can be achieved by allowing a maximum of 100 watts ERP for this class, with the current antenna height restrictions being considered. Higher power levels can be applied for under current regulations. Thank you.
