

I would like to see some form of approval of MICRORADIO stations that would allow less than or up to ONE WATT of power to cover poor listening areas INSIDE BUILDINGS, small complexes, etc, for pickup by walkman type radios. The power could be limited to no more than that needed to cover approximately 100 to 400 yards (1/4 mile or less). Quality of transmission would be maintained so as to NOT create interference on adjacent FM channels. Thank you very much for considering low-power FM broadcasting needs.
