

Using the proposal there is the possibility of new "low power" stations operating at a higher power than our present facility. Under the present rules we are limited to 415 watts. Under the new rules one of the new FM stations could come on air with up to 1,000 watts in our community.

It is my hope that the Commission consider allowing lower power stations like ours (WLNZ, Lansing, MI) to use any new technical lessening of the interference rules to increase power to before allowing new stations on the air.
