

After much reading over the past months I feel that a LPFM service up to 1000 Watts is very feasible. I also feel that the second and third adjacent channel restrictions should be removed for this service. The selectivity and quieting characteristics of modern receivers will tolerate this. I realize that the NAB and other organizations are attempting to block the formation of this service. It is my opinion that this is primarily driven by dollars not by real world data. I give my support for the formation of this service.
