

I live in a small mountain community devoid of most Television and Radio signals of an acceptable quality. I am interested in starting a low power FM transmitter to serve the immediate community (1-2 miles). I am in favor of the 1-10 watt "micro-transmitter" that you propose. I feel this is a good way to serve the smaller communities that that cannot attract larger more powerful stations. I am currently experimenting with a Part 15 FM transmitter that can easily be upgraded to a "micro-station" 1-10 watts if you should allow such stations to operate.
