

I am corresponding to the proposed rulings for ground penetrating radar. GPR has been used at the Los Alamos National Laboratory for quite some time now, approx. 8 years. Within that time span, GPR has been instrumental in achieving a safer work environment. Many of our projects require that scans be made into the ground, walls, ceiling, floor, etc. The ability for the construction crews to locate what objects may be present within the penetration area is invaluable to the safety of the project.

We ask that this proposal not to prohibit the use of GPR on the walls, ceilings and floors, as they extremely dangerous and can hide all sorts of conduits. utility lines, rebar, etc.
