

1 we'd like to pick up in the next 10 minutes or so.

2 MR. WOERNER: Yes, I think Ray's  
3 remarks really lead into that. There is certainly  
4 a huge variety of very sophisticated signal  
5 processing techniques out there and they do a very  
6 good job of coping with self-interference. They  
7 are capable of interfering with legacy systems.  
8 And I guess the final question we want to pose to  
9 our panel is how the FCC rules affect technology  
10 and development. Are there -- is there a  
11 sufficient push to improve the performance? Is  
12 there a sufficient pressure on legacy systems and  
13 we'll go down our panel and we'll start here with  
14 Jack.

15 MR. WENGRYNIUK: Well, again, from a  
16 satellite perspective since that's the only  
17 industry I've worked in for 25 years, the FCC's  
18 rules, certainly over time, have evolved such as,  
19 in my opinion, to push satellite systems. Take for  
20 example the KA band where you've got a requirement  
21 for 2 degree spacing, a requirement for use of  
22 adaptive power control, a requirement with the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 FCC's rules to essentially tolerate an  
2 interference-limited environment. Certainly, with  
3 the desire to get as much, to squeeze as much  
4 capacity out of the geostationary orbit and to use  
5 the geostationary orbit as effectively as possible,  
6 the FCC's rules have, in fact, in my opinion,  
7 pushed satellite providers where they probably  
8 wouldn't otherwise have gone because of the costs  
9 and technical complexities involved. So in that  
10 sense I would say that the Commission's rules, have  
11 in fact, pushed the satellite industry.

12 MR. WOERNER: Historically, most of the  
13 regulation has primarily focused on the  
14 transmission end where -- what signals can be  
15 admitted and what bands, to what extent do you  
16 think it is appropriate to regulate the receiver  
17 side of the system?

18 MR. WENGRYNIUK: Well, certainly, this  
19 is speaking personally now, I believe there is a --  
20 there should be a responsibility on the part of the  
21 receiver to take reasonable steps to protect  
22 themselves from interference, proper filtering,

1 that sort of thing, to suppress adjacent band  
2 signals. There's only so much you can do with  
3 interference that occurs within your band.

4 Dr. Pickholtz spoke of some of the  
5 things you can do if you had some a priori  
6 knowledge of where the interference is coming from.

7 But when it's coming from a different service or a  
8 different system that you have no knowledge of,  
9 there's only so much that you can do to mitigate  
10 that.

11 In the satellite area again, because of  
12 the very nature of the service, we're receiving  
13 very weak signals from space. We tend to have  
14 fairly sensitive receivers and fairly high quality  
15 receivers. Even in the consumer market, there's a  
16 certain quality standard that has to be met in  
17 order to get any sort of a reasonable quality of  
18 signal out. So in that sense the satellite  
19 industry is almost self-policing, but certainly  
20 from a broader sense, I would think that there  
21 should be some consideration given to receiver  
22 standards.

1 MR. WOERNER: Great. Jack Rose, maybe  
2 you'll share some perspectives on the implications  
3 of this discussion for regulation.

4 MR. ROSA: Maybe I can address a couple  
5 of points that were made along the way and pick up  
6 on them. I think it's time, I think it's radically  
7 time to move from what I would call the myopic view  
8 to a holistic view. The FCC is predominantly  
9 focused on taking care of transmitters. In fact,  
10 the definition up there was sort of archaic. So  
11 it's time to move on to the -- what the environment  
12 is today.

13 And we need to look at both. We have -  
14 - if you want purified transmitters and making the  
15 receivers less susceptible and the technology again  
16 exists to do both of those. And there are optimum  
17 gains to be made. Now one of the two things that  
18 the FCC can do. The one point I tried to make  
19 before was this perception that high tech, next  
20 tech is going to cost more. The indications, in  
21 fact, are it's going to cost less. In fact,  
22 dramatically less. I don't mean just 10 percent

1 less, maybe half to one third, one fifth of what we  
2 pay today for systems. So the expectation, by the  
3 way, of the Defense Department, if you pile up all  
4 the radios they buy, you're talking big bucks.  
5 Anyone who wants to buy one for \$50,000 that does  
6 all these tricks and it's a cheap one. So the art  
7 and the science exist to get there. They exist in  
8 the commercial world and exist in the Defense  
9 world. But are the incentives to go and do this?  
10 That's what the question is. Why would I want to  
11 move forward. I see this as two components. One  
12 is the FCC again taking the homogenizing this and  
13 becoming the driving force to accelerate the  
14 course, to cause it to happen sooner rather than  
15 later. Let's get proactive rather than reactive,  
16 my message there.

17 Second is just business sense. You  
18 must have incentives. And maybe some simple things  
19 like a -- how much you spread into other spectrums  
20 is a function of your licensing thing. I've got a  
21 simple picture that's at a level and if you get to  
22 this level, you pay X dollars a month and if you

1 get to this level, you get -- maybe at some point  
2 you get y dollars back, in fact.

3 (Laughter.)

4 Penalties and incentives, if you will.

5 You can readily determine what those thresholds  
6 are, okay? It's not rocket science either, by the  
7 way. It's very simple. You make the penalties and  
8 incentives attractive enough that a reasonable  
9 business man will make a no brainer decision. In  
10 one year, if I can get my money back, then I'll go  
11 do it. See? You need to have something that makes  
12 sense from a business aspect.

13 I think in issues like that which I  
14 know are -- these are dramatic from the way we  
15 behaved in the past is what it's going to take.  
16 It's going to take some radical departure from  
17 conventional thinking, to accelerate -- to speed up  
18 the film, to accommodate what the world wants.

19 MR. REPASI: Dale, do you have a few  
20 brief comments?

21 MR. HATFIELD: Since I was on two  
22 panels, I'm going to yield my time to my

1 distinguished colleague to my right, except for  
2 making one -- I have to say that maybe we ought to  
3 look at sort of interference trading rights to just  
4 like you have pollution trading rights.

5 (Laughter.)

6 There may be some opportunity here, but  
7 to people at the edge to say gee, it's cheaper for  
8 you to fix it than it is for me and I'll pay you to  
9 fix it.

10 We may want to allow some economic type  
11 forces to get into that trading as well.

12 MR. LOCKIE: I have two comments here  
13 and before I ought to pass off some credit for  
14 them. Often, we come up from Silicon Valley to the  
15 FCC with some ideas, you know, and often we end up  
16 in Mike Marcus' office because, particular  
17 millimeter wave community and often he offers us  
18 another suggestion that is maybe one or two or  
19 three or 20 dB better than the idea we walked in  
20 with. So Mike, I'd like to thank you for all your  
21 help over the years in passing off ideas. Some of  
22 this stuff is yours.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

1                   Two things, one I recommend that we  
2                   look  
3                   -- there's a lot to be said for the old -- a lot to  
4                   be said for software-defined radios and all this  
5                   stuff that we can do in the processing world to  
6                   make things better. There's still no substitute  
7                   for antenna gain and side lobe control and  
8                   frequency control to orderly fashion reuse spectrum  
9                   and make things better. So not to downplay that,  
10                  just build on top of it. But along those lines, I  
11                  think there's one thing we really want to explore  
12                  and we're pushing this in the NPRM 7181 and 92  
13                  gigahertz is electronic filing and electronic  
14                  coordination. This is another example. When we  
15                  got computers now that for 500 bucks, you can buy a  
16                  computer that can keep track of all the spectrum  
17                  and every transmitter received around the world, so  
18                  I would suggest a couple of things. We take a page  
19                  from the radioastronomy community and the way we're  
20                  doing filings there that every geographical area is  
21                  a website, heartbeat. And that every new license  
22                  coming in has it's own URL and with V6, Version 6

**NEAL R. GROSS**

[www.nealrgross.com](http://www.nealrgross.com)

1 of the internet with unlimited numbers of  
2 addresses, it's a heartbeat.

3 In the process of all that, and some of  
4 you want to take a look at some nice things going  
5 on, go look at Donald Draper's software. It's  
6 nascent. You need batteries, you need some  
7 assembly and don't do it just at home, but this is  
8 a beautiful example of very cost-effective mapping  
9 software and electromagnetic software that we  
10 should be able to build on top of that and not have  
11 to waste \$3,000, \$4,000 or \$5,000 per filing doing  
12 this coordination. Phone calls back and forth,  
13 missed calls, a lot of expense tied up there. We  
14 ought to be able to minimize that down to a few  
15 hundred dollars per site license. I recommend we  
16 look at that some more.

17 The other thing is I recommend that the  
18 FCC start looking at what are the basic physics of  
19 each spectrum band and what it's good for and I'll  
20 make a suggestion here and I hope Jack Valenti  
21 doesn't put out contract on me here, but two of  
22 the most valuable chunks of spectrum according to

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 physics for mobility for 3G, for 4G, for 5G, is VHF  
2 and UHF television. Now it's also some of the most  
3 important spectrum in the country in terms of  
4 keeping the economic base going, because that's how  
5 you get a pair of jeans to cost \$90, 50 percent of  
6 it goes to advertising, but at any rate, if we  
7 could figure out a way, if there was a way to get  
8 the VHF and UHF broadcasting community to say hey  
9 wait, I'd like to give back my spectrum and get  
10 some of this new stuff, and I have a suggestion for  
11 what that might be and probably other folks will be  
12 able to come up with better ideas, but if we went  
13 off and built a satellite with about a 300 or 400  
14 foot antenna, can't do that today, because it's  
15 just too hard. A rocket is only 12 feet wide at  
16 the top and the antenna is limited to 12 feet if  
17 you want a cheap satellite. But we can build  
18 antennas today a couple hundred feet in diameter  
19 and we can probably expand that out to 400 or 500  
20 feet and if you had an antenna that big, you could  
21 have a thousand simultaneous spot beams. Now if  
22 you had a thousand simultaneous spot beams and with

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealgross.com](http://www.nealgross.com)

1 that kind of antenna gain, you only need a quarter  
2 watt drive in each one of them instead of 25 watts.

3 Well, you could have power up for 10 watts or to 5  
4 watts on each one of those and so you'd pick up 15  
5 or 18 dB of link margin for when it's raining and  
6 it's only about 10 percent of the country has got  
7 rain going on at any one time so the satellite's  
8 average power would remain pretty constant and you  
9 could go to 62 QAM or 256 QAM and so you could have  
10 100 channels for local broadcasting and every spot  
11 beam. You could have 100 channels of educational  
12 and you could have 800 channels of video that's  
13 just what we're watching today and you could  
14 probably upgrade it all to HDTV as we went from 256  
15 QAM to 1024 QAM.

16 So I think there's a lot that we could  
17 do in terms of not sponsoring, suggesting or  
18 catalyzing ideas like this to take back some of the  
19 spectrum that's maybe being not wasted, but not  
20 optimally used in terms of what the physics would  
21 like you to do with it.

22 Before you laugh me off the stage, I

1 ran this by Tony Tether, the other night and I said  
2 Tony, what do you think of this and he said we've  
3 already done far more than that. I said oh, that's  
4 interesting. How do we get you to DARPA to get  
5 involved with this? We'll make it a software  
6 developed, defined radio and that would be all  
7 behind you. So now I'm going to modify my  
8 satellite to make it also software defined and then  
9 we get DARPA involved in it as well.

10 (Laughter.)

11 A couple of thoughts.

12 MR. REPASI: Well, maybe I can open it  
13 up. Does anybody have any closing thoughts?

14 DR. PICKHOLTZ: Well, I have another  
15 alternative to the VHF/UFH buy out. Buy them out  
16 and give them a fair charge to make it compatible  
17 with cable system. I have a Yagi on my roof I  
18 haven't used in 10 years, so cable is pretty good.

19 Not as good as it should be, but it's pretty good.

20 I just want to say one closing comment.

21 This comes from my favorite editorial, way before  
22 the FCC was formed. It's a lesson from the past.

1 It's from the Boston Post, 1865, probably some of  
2 you know it. "Well-informed people know it is  
3 impossible to transmit the voice over wires and  
4 that were it possible to do so, the thing would be  
5 of no practical value."

6 (Laughter.)

7 MR. WOERNER: I'd like to thank our  
8 panelists and hopefully the predictions made today  
9 are a little more accurate than that one.

10 (Laughter.)

11 I think it's going to be an interesting  
12 discussion after lunch, I think on the regulatory  
13 implications to some of this.

14 MR. REPASI: I'd like to make a couple  
15 closing remarks too. I think that the Boston Post  
16 article was on point because it mentioned wire  
17 line. It didn't say anything about wire less.

18 (Laughter.)

19 Wire less possibility --

20 MR. WOERNER: There's another saying  
21 from Marconi, but I won't go there.

22 (Laughter.)

1                   MR. REPASI: I too want to thank the  
2 panelists for coming from all over the country  
3 basically to participate in this very nice effort  
4 to have you guys here. I also wanted to point out  
5 that we've got about an hour, or a little bit less  
6 than an hour before the next panel will start, if  
7 everybody could be here at 1:30 to reconvene for  
8 Panel 3. Dr. Tom Stanley will be co-moderating  
9 that with Chuck Jackson, so a lot of exciting  
10 things to continue on with in the afternoon  
11 session.

12                   Thank you.

13                   (Applause.)

14                   (Whereupon, at 12:30 p.m., the workshop  
15 was recessed, to reconvene at 1:35 p.m.)

[www.nealrgross.com](http://www.nealrgross.com)

1 A-F-T-E-R-N-O-O-N S-E-S-S-I-O-N

2 1:35 P.M.

3 MR. STANLEY: Welcome to Panel III of  
4 this look at interference protection. Earlier  
5 panels picked up the subject of interference  
6 challenges and also what advanced technologies can  
7 do. Here, we're trying to focus at something a  
8 little bit differently. It's a look at the  
9 regulatory process, what we do with interference.  
10 The FCC really doesn't design radio systems. We  
11 really design regulatory systems that people design  
12 radio systems within.

13 So what we'd like to do here is kind of  
14 look at our own regulatory process and how we  
15 manage the interference function.

16 The FCC actually touches -- using  
17 interference, touches a wide array of activities.  
18 For example, not just allocations and sharing,  
19 where which services can fit with which and what  
20 services can actually share the same bands where  
21 interference protection is fairly obvious. But in  
22 our definitions of service rules, how flexible we

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 can be, but also licensing and coordination, the  
2 actual site by site coordination of facilities to  
3 include even international ones and even an  
4 enforcement. And let's say the lives of people we  
5 touch, it's not just existing services that are  
6 trying to grow and existing services offering new  
7 features, but also new ideas coming to the  
8 marketplace, people trying to seek establishment in  
9 the telecommunications world.

10 All these basically come back to  
11 interference protection to some degree and the  
12 FCC's ability to define it and enforce it.

13 Let me introduce our panel of that  
14 broad array of people whose lives we touch. I  
15 think we have most of those dimensions with us  
16 today. But first let me introduce my co-moderator,  
17 Chuck Jackson. Chuck is a well-known  
18 telecommunications expert in the Washington area.  
19 It's probably not widely known, but actually  
20 Chuck's Ph.D thesis, as I recall, actually touches  
21 on spectrum management going way back --

22 DR. JACKSON: Don't tell them how far

1 back.

2 (Laughter.)

3 MR. STANLEY: All right. Let me  
4 introduce the panelists and I'll do it  
5 alphabetically, I guess, starting on my right.  
6 Phil Barsky is regulatory spectrum management and  
7 systems engineering consultant for XM Radio. XM  
8 Radio, as we've heard earlier, is one of two  
9 licensees that offer digital radio service in the  
10 United States.

11 Steve Baruch is a member of the law  
12 firm Leventhal, Senter & Lerman. Steve is also a  
13 very familiar face here at the FCC. Steve  
14 represents a variety of satellite entities. We see  
15 Steve a lot also in particular in some of the ITU  
16 preparation work. I mean, I think of V band and I  
17 think of Steve Baruch. He just kind of goes  
18 together.

19 Also Mark Crosby. Mark is the  
20 president of Access Spectrum. Access Spectrum is a  
21 very important and new development, relatively  
22 speaking, in the Commission's process of looking at

1 different ways of getting people access to the  
2 spectrum. In addition to that, and we'll get back  
3 to the guard band manager idea a little bit later,  
4 Mark actually was president of ITA before the name  
5 changed to then CERCA. So actually he has a long  
6 and deep history of involvement with the frequency  
7 of coordination process.

8 Dave Hageman. Dave comes to us, he's  
9 vice president of operations, wireless operations  
10 at a company called Poka Lambro Telecom. And  
11 that's actually a wireless cooperative in the  
12 middle of the country. And I'm going to ask him to  
13 tell us a little at the right time what that stands  
14 for. Dave brings some of what I call the rural  
15 perspectives of wireless operators to the table.

16 Nancy Jesuale brings the metropolitan  
17 orientation to the table here. Nancy is director  
18 of communication services for the City of Portland.

19 Richard Smith, spectrum radio  
20 management consultant. He's a consultant who, I  
21 guess, spends a great deal of time traveling  
22 recently. Most of us know Dick. He was the chief,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVE., N.W.  
WASHINGTON, D.C. 20005-3701

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 our top cop for enforcement in what used to be  
2 called the Field Operations Bureau and later ran  
3 the Office of Engineering and Technology.

4 And John Storch is executive director  
5 for engineering and technical operations for  
6 Western Wireless, a wireless carrier bringing us  
7 some wireless carrier perspectives coming from  
8 Washington State.

9 A variety of things that had come up  
10 earlier in our discussion, I'm not even sure we can  
11 even get to all of them, but we're going to try to  
12 sort of touch on several of these topics.

13 Let's start with the first notion as to  
14 what the FCC really does. We can argue over the  
15 definition of interference and whether or not we  
16 should get a new one or not. But let's lay that  
17 question aside just for the moment and look at it  
18 maybe from a slightly different perspective. Maybe  
19 it isn't the definition of interference, but it's  
20 really the FCC's decision process when we decide on  
21 an allegation or service rules or whatever  
22 particular action we take. Interference is usually

1 implicitly there. Sometimes it's so implicit that  
2 you can read the text and you won't find the word  
3 interference. You might find and therefore we  
4 think sharing is possible. And it will be in one  
5 sentence, and if you read fast you can go right  
6 past it. But it's there. And there they'll be  
7 height and power or field strength or some other  
8 technical specifications. Sometimes there won't  
9 even be a discussion of certain kinds of potential  
10 for interference, adjacent channel out-of band.

11 So at times it's said that we are ad  
12 hoc in our decisions. Too ad hoc. We address the  
13 issues before us. The lawyers tell us don't say  
14 anything more than you have to. And as such over  
15 the years, we have sort of let's say a fabric of  
16 decisions, rather than sort of maybe a body of that  
17 says interference is a very well defined thing.

18 So I wonder if the panelists would shed  
19 some light on what they think when the Commission  
20 basically makes allocation decisions, sharing  
21 decisions, and you've certainly been a part of  
22 this, or in the coordination area.

1           Are there things that we're not clear  
2 about or perhaps we could do a better job, and if  
3 so, how? And I'll take volunteers for this but  
4 maybe I'll start with Phil.

5           Phil, in our decisions, are there holes  
6 of commission, omission, sins rather?

7           MR. BARSKY: I've been involved with  
8 the FCC since 1959 as an amateur. And surely, I  
9 haven't agreed with all the decisions and have not  
10 been involved as deeply in the process as I have  
11 been with XM.

12           I think there's nothing wrong with the  
13 process. Perhaps because of the complexity of  
14 systems and what's going on, some of the  
15 methodologies might have to be augmented. For  
16 example, we were just talking about in-band  
17 sharing. Well, to XM we had to do some special  
18 things between us and Sirius. So we're right  
19 adjacent to one another. In addition, we had to do  
20 some things within our band. Our satellite receive  
21 band for our repeater is 2 megahertz away from the  
22 transmit frequency of the repeater. We had to come

1 up with some very, very fancy transmit filters.

2 So we had to do some things in-band,  
3 but most of the things that affect us have to do  
4 with

5 out-of-band emissions from other services. And it  
6 didn't become a real issue, or it doesn't become a  
7 real issue until you look at the relative  
8 deployments and architectures between two systems,  
9 or intended architectures between the two systems.

10 For example, one of the architectures I look at is  
11 what's going on inside the automobile. Another  
12 architect is what's going on inside of a house or a  
13 building. What are architectural differences  
14 between certain wireless neighbors and doors? To  
15 look at the question of whether you're going to  
16 interfere or not, you have to understand what your  
17 neighbor system is, or what its deployment is, vice  
18 your deployment to understand just how much energy  
19 each one is going to put at each other's receiving  
20 antenna.

21 And if you boil it down to my very,  
22 very simple -- I'm from Brooklyn originally, the

1 very simple definition of interference is how much  
2 of my energy am I putting at that receiving antenna  
3 versus the signal that, very early in my case, I  
4 was on channel 1 or the old six meters and my  
5 neighbors were trying to receive channel 2. So as  
6 long as their reception of channel 2 was stronger  
7 than my signal on channel 1, or six meters, I was  
8 okay. In a lot of cases that wasn't the case and I  
9 had to help the neighbors out in filtering in their  
10 TV sets.

11 I believe with the ubiquitousness of  
12 802.11, hot spots that have been coming in vogue --  
13 bluetooth, piconets, and personal area networkz,  
14 and ad infinitum and it's just an explosion out  
15 there, I think that adjacent services that are  
16 close enough to interfere with each other must look  
17 at the deployments of each and the architectures of  
18 each to evaluate the interference potential. And I  
19 think that's probably what's different these days.

20 MR. STANLEY: Steve, from a legal  
21 perspective, somehow we could be saying a lot more  
22 about other aspects of interference, but frequently

1 the record isn't there. It's astonishing sometimes  
2 that only after a major decision is made to share  
3 is attention put out to power. And we get recons  
4 for love the decision, but hated the power. And so  
5 again, recon a few more dB, please.

6 Should we be doing more proactively?

7 MR. BARUCH: Well, Tom, when I stopped  
8 and thought about what it is that could be done or  
9 whether how this process works, I guess the first  
10 think I asked is is the process broken? And I had  
11 a hard time coming up with the answer to that, but  
12 the answer to me is not really. I think it works  
13 and I think it works right. And here's why. You  
14 start out with allocation level decisions as you're  
15 looking at gross compatibility of one service with  
16 another in a particular frequency band of range of  
17 bands. You have to take into account things like  
18 the existing services, evolution of the existing  
19 services, adjacent services and other sorts of  
20 compatibility. But you can do that on a gross  
21 level without getting into too much in the way of  
22 how actual systems that would operate in that band
