

My company, Hunt Brothers, has been providing wireless broadband Internet access to local business in Franklinton, La for over two years now. Franklinton has a population of about 4500 residents so we are considered very rural. We are currently using 2.4ghz equipment and would love to have more freq. available especially in the lower spectrum around 700mhz so we can provide reliable, affordable internet access to residents also. The problem with 2.4 is you have to LOS (Line Of Site) where as LOS is not as important the lower the freq. so if we had use of 700mhz we could provide access without trying to work around the trees. Thanks for listening.
