

Anything you can do to increase Non-line of sight abilities (open other bands ie:700MHz) or boost rural abilities of wireless will certainly help private ISPs develop wireless infrastructure in the US. Unlicensed fixed wireless is a great solution for super high-speed internet access. It seems that building the infrastructure (towers, etc.) will also assist in future deployments of mobile data solutions that will greatly assist Police departments in rural areas. Fixed wireless and mobile wireless will rely on similar standards. If we are really tired of wires and fiber lets switch to the much more flexible wireless infrastructure.
