

NextWeb, Inc. is California's largest fixed wireless broadband service providers. NextWeb serves the business community in over 60 cities in Northern and Southern California.

NextWeb supports the allocation of additional spectrum, particularly at the lower frequencies, for use by fixed wireless service providers for the delivery of competitive data services to the business and residential community.

Insuring adequate spectrum for the delivery of high speed data services is of key concern for the delivery of true broadband speed service (over 1Mbps to each subscriber). Lower frequencies that have ability to get through trees, and other such obstacles is also important.

Unlicensed Fixed-wireless broadband is one of the few, if not the only viable solution that is truly competitive to the monopoly controlled telco and cable networks. Opening up additional spectrum and fostering additional deployment of fixed wireless broadband services is an important step in expanding broadband throughout the country.
