

Thank you for this opportunity for public comment.
My company has provided dialup service for six years and wireless broadband for 2 years to our small rural community and it's outlying areas. Currently we use Alvarions 2.4 BreezeAccess products and Waveriders 900 mhz line. For the majority of our customers, wireless broadband is their only available or affordable means of high speed internet access. We also provide free service to our local library for those without means to purchase the service themselves. The major obstacle we have encountered during our time of wireless deployment has been non line of sight issues. With this in mind I would welcome any FCC rulings that would allow the use of higher transmission power levels in point to multipoint applications in unlicensed frequencies and also use of the current TV frequencies with their superior nlos characteristics due to become available soon.
