

Considering the fact that BPL has been tested in other places like Japan and Europe besides in the U.S. and found to be highly detrimental to HF communications I believe that it's deployment and implementation would be detrimental to the HF communications of anyone using the HF spectrum including hams, military, government, and private concerns. The needs and interests of all these groups should not be tossed aside to serve the interests of a few groups that merely could make money from the deployment of BPL. Existing communications need to remain the first and foremost concern in these cases. BPL will destroy these comms.
