

On the proposed BPL and after reviewing this subject in great depth, I would recommend against it as it would create harmful interference to all users on radio frequencies below 80 MHz. The concept will create a large radio field of pulsed interference, similar to spark transmissions of the 1920's, which became so interferful to commercial radio broadcasters that the FCC prohibited it's use. The concept of the power lines across the country doing this would create wide spread interference across our country, paralyzing any type of traditional mode of radio communication wherever this system is in place.
