

While Power Line Communications (PLC) may look promising, especially to us who live in rural areas not economically covered by any high speed communications services, the potential of interference to services currently in use cannot be ignored. This service has met with many interference complaints in countries where it has already been used. The PLC service has the ability to interfere with every radio service up to 80 MHz. I am sure that many of these services are also capable of interfering with the PLC system too. Please consider the effects of PLC on these other services when making inquiry into this matter.
