

Dear Commisssioners,

Although I understand the appeal of BPL, I feel it is a bad ideal. Power lines are not design to carry RF and despite the best efforts of man, they will make effective antennas for the BPL signals. The harm it would do to HF communications would not be offset by any benfits BPL would provide. In England, despite the tight emmission standards, the providers of BPL have admitted that the emissions from there service would raise the noise floor accross the HF spectrum. The cable, wireless, and landline companies already provide excellent sources of broadband access and home networking and 802.11 can allow anyone to access the Internet from any room in their home.

Thanks for considering my comments,
Bret A. Boggs
