

At this time of burgeoning demand for spectrum, I believe the Commission's efforts should be directed to ways of minimizing unnecessary interference rather than encouraging it. The idea of Power Line Communication is exactly the kind of thing we do not need, given its proven record of spurious emission, and the difficulty of guarding against it.

When radio communication becomes--as it has--a vital component of disaster and emergency preparedness, I do not believe we can afford to jeopardize it by setting up mile after mile of radiating joints and cable.

Please reconsider this course, and let good sense overrule economic expediency. Please.
