

This is my second comment to this mess.

Noise is greater today than ever before, now, noise from power lines, insulators and transformers are common and require going thru red tape with the power companies to get someone out to investigate the source.

The power companies are in a business to provide power NOT additional crap such as computer traffic on their grid lines.

Noise will be created even more with big business money to use power lines for their greedy endeavors.

Don't let big MONEY business introduce any crap to the power companies, let big business use the twisted pair copper or FO.

No to BPL or PLC.
