

I oppose the broadband over powerline delivery system of 03-104.

Two issues convince me that it is basically the wrong approach to delivery.

1. The lack of security - What is in the air is open to all.
2. The increase of noise floor in H.F. frequencies is detrimental to all users of that spectrum.

I believe in the long run, a fibre optic to each home is the best investment.

Yes, it is much more expensive, but it will be there a very long time and offer superior performance and security.

An old adage: Quality is remembered long after price is forgotten.
