

I am OPPOSED to Broadband over Powerlines. Most public utilities are not concerned nor do they have the technical staff capable of properly maintaining such a system. It is nearly impossible now to get them to correct defects in their power line distribution system that causes harmful interference to other licnesed services. I shutter so think of the noise generated with such a system. If they are willing to install a shielded system for distribution such as the cable compaines have done, then I could support their request.
