

We are very concerned about data over power lines as it will disrupt the communications on the amateur radio bands, we already have enough noise on our bands from man made equipment making it difficult to communicate and get emergency traffic run at times. We are here and always ready to do our part for protecting the public in the event of a terriost or natural disaster. However with the over the wire sending of data over power lines it will make it nearly imposible to communicate to someone in distress. You are aware of all of the equipment that hams have at thier disposal to communicate in times of trouble and disasters it would be a shame for the ham community to have another noise maker competing with said communications. It is my opinion that would be a major mistake and would disrupt the ability of our communications for the public at large, especially now that we have even more need for good reliable communications in light of 9/11. Thanks for you time. Dave Jolley NZ7J Afton Wyoming
