

I respectfully request the commission to consider prohibiting the use of BPL/PLC on the HF bands. There have been numerous studies by other countries; Great Britain, Germany, and Japan to name a few that prove the enormous amount of interference produced by this form of communication.

The military, marine service, short wave broadcasters and amateur radio use the HF spectrum on a daily basis to communicate between stations and listeners world wide, and if implemented BPL/PLC threatens to shutdown HF communications as it is known today.

Before voting to allow this to go forward take a hard look at the huge amount of RF spectrum that will be made unusable for licensed stations. The commission already deals with too many harmful interference complaints dealing with "incidental radiators" from utility companies, are you really willing to take on the additional burden this will cause?
