

I do not believe Power Line Communications is in the best interest of the country. A large number of spectrum users will likely be disrupted unless a full engineering study is completed by an impartial study firm. Power lines are not shielded and I believe will radiate harmful interference across a wide spectrum. I believe the Commission should investigate what has happened in other countries that have implemented this to understand the real-world impact of this approach to communications. Without full knowledge of the impact considerable harm will be done to current users of the HF spectrum.

Thank you and best regards,

Edward A. Long
