

Since Power providers are using open wire transmission technology in order to distribute electric power it should be obvious to even a semi-technical individual that:

1. Interference is now caused to various services from power lines which are frequently poorly maintained.
2. Adding additional electromagnetic radiation to antennas which pass by nearly every american is technically unsound on the face of it and will result in massive interference to many existing services rendering many as useless.
3. Even cable services which use shielded technology have very serious leakage problems, the proposed system using existing infrastructure without shielding for transmission of data is a proposed disaster.
4. liscenced public service lines of emergency communication would be in immediate danger at a time when our nation needs them most.
5. The FCC rules regarding excessive radiation themselves would be violated.

It seems a poorly conceived notion designed by minds more concerned with the next quarterly report then their nations emergency communications system.
