

To whom it concerns,

In the recent months, a popular new form of internet communication has been installed in various test areas in the world. This "Broadband by Power Line" form of communication violates several parts of FCC law and action should be taken to remove this interference caused by this form of communication (from here on called "BPL"). It is known that BPL interferes with the Licensed Amateur Radio Service in the United States and other countries in the world. Because of the mass interference with the Amateur Service, questions arise about the potential for interference with other devices in the Part 15 area. How will devices like cordless phones, televisions, ect. be effected by BPL? Before BPL can be used in the US, I believe that these issues be looked into and dealt with. I am a licensed Amateur Radio Operator (KC0PNH) and BPL causes great interference on the FCC

alloted Amateur "bands" and would greatly interfere with emergency efforts in the event of one. Again I believe that great care should be taken when dealing with this subject of BPL and hopefully a mean can come of being able to use BPL in the future. Thank you so much for considering my comment.
