

I respectfully urge the commissioners to consider the HF interference concerns that arise from ET Docket 03-104 in light of the power industry's claims concerning the present Power Line Carrier services.

Power companies claim that the low-frequency RF used in their systems is non-radiating, yet many PLC carrier signals are detectable over large portions of the United States.

I respectfully suggest that the commissioners require a practical demonstration of the new service's interference potential, not just theoretical submissions.

Kind Regards,

David Stinson, ARS AB5S
