

I feel that to let a power company that can not supply good power try to transmit the internet over the same wires is not in the best interest of anyone except the few people trying to make money selling snake oil.

With all the noise they generate around this area you could give them the broadcast band, you can only hear the closest AM stations because of the noise in the power lines.

This noise comes from bad hardware ,loose connections and cheap insulators.

Before you grant any power company permission to run data on it's lines you should have them prove that they are not screwing anything else up and if they are screwing anythings up make them fix things up.By the time the power companies in Northern Wisconsin get their lines cleaned up for ELECTRICITY there will be a better way to transport the internet than the power lines.

The REA companies should never granted permission to sell anything but GOOD CLEAN power.
