

Part 15 provides more than enough interference to Amateur Radio in the affected bands of this NOI, as well as interference to any monitoring of International Shortwave Broadcasting. The option of a source of internet access that provides more radio frequency moice in an urban or suburban enviroment does not appear to be a good use of our currently available spectrum. Monitoring and interference resolution would need to be increased to accomadate any possible, anticipated or unanticipated increase in interference to licensees withing the current spectrum under condideration.
