

As a Broadcast Engineer who presently spends far too much time trying to help the public resolve interference/reception issues. I am appalled at the idea that the Commission would ever allow the deliberate distribution of signals in the 2-80 Mhz region via power line distribution systems. One wonders if the FCC's ultimate plan is to eliminate over the air signal distribution completely. Please reconsider this folly and before proceeding do a in depth technical study of the ramifications to other present services that would be affected by this proposal.
