

I would like to oppose BPL, because from what I read, there are not enough safeguards to insure non interference to other radio services. At the present time I do much weak signal work on the amateur 6m band. Plus I live right next to hi tension power lines. Just an increase of 1 db of interference/noise would be nough to keep me from engaging in this. I have also read that BPL has been tried in Japan. According to several amateur radio operators there. The subsequent interference forced them off air. I understand that Japan is trying to resolve the issue. It seems to me that the FCC needs to think this thing out, before making a hasty decision.
