

I do not support this proposed method of data distribution. There are already adequate high tech solutions and the significant probability of broadband HF noise generation clearly exists. At the very least, adoption of such a technology should be beta tested on a very limited and temporary basis to thoroughly evaluate noise and interference issues. As a user of HF spectrum both on an amateur radio and commercial marine basis, I would add that we do not need additional noise sources and this proposal appears to have significant downside. Thank you for your consideration. N7OTQ
