

Broad band over power line technology has the potential of causing a lot of RF interference to various services. The RF environment is getting more and more polluted and with BPL the possibility is even enhanced! Switching power supplies, electric fences, IMD, etc. is contributing more contaminating sources. I would advise against this potential RF source at this time.

A lot of services that start off innocently develop into RF problems for many services and little can and is done about abating such interference.
