

With the experiments being conducted in foreign countries, notable Japan showing that sending broadband internet service over the powerlines causes interference to the HF spectrum especially the amateur bands, I see no reason to spend any of our money on pursuing this any farther. I admire the FCC for wanting to deliver this service to as many as possible but I think there are better methods of doing it. I think since the department of homeland security has just named amateur radio as one of the first of the first responders the FCC would want to protect the small portion of the radio spectrum that amateur radio is given rather to destroy it. Thank you
