

I have no broadband where I live and probably will never have it. No cable expected out in here, anytime soon. By that i mean 10-20 years. DSL is a no for me. T1 line at 500 a month is too expensive. I need broadband and am willing to even pay up to 100.00\$ a month for it. If this can be deployed All across the US it will recieve millions of customers. I think this will even compete with DSL and CABLE internet. If anyone out there hears me Come to South Carolina First, we are broadband deprived, and we have about 400 people in are small town that would love to get broadband. Be smart and target rual areas. The big cities already have all they need, It's the millions of people in the *woods* that need broadband options, not people that have everything already available. In your testing, dont just test in metropolitian areas go out in rual areas and test. It would be great to get this out everywhere. Keep it up FCC your doing a good job.
