

Sirs:

I have studied your proposal, and find it not being field tested enough. Amateurs feel that this will cause a lot of interference to bands. You should review other means of sending data. You have taken over all areas for commercial use. Amateur is needed in time of disasters and must have non interference bands. Please see what amateur radio did during the subtle disaster. Cell phones were useless, amateur radio took over and provided the way of communication. We must be clear of interference. This technology has not been proven enough. You need to police the power company's more. They just want another way of generating money and harm to anyone else.
