

Recently, the FCC has been very supportive in resolving interference problems that Amateur Radio operators have had from power lines and electric fences. This is much appreciated.

However, how can the adoption of BPL which will result in a VERY significant increase in these types of problems be considered? Is the FCC prepared to support the resolution of all of the interference cases that result from this technology? Or is the FCC saying that interference from this technology will not be considered a problem?

This boggles the mind.
