

My comments concern the Broadband over Powerlines (BPL). While the power companies are rushing to utilize this technology they are doing so with blinders on at full speed. They have arrogantly proclaimed that there is no interference to the spectrum used (2mhz to 80mhz). Their representatives claim that the burden of proof that there is interference is on those that don't believe them. This attitude alone should raise the hackles of anyone listening to their proposals.

The American Radio Relay League has been doing extensive testing and have found that the interference to every segment of the radio spectrum being used is horrific. In fact it renders that spectrum completely useless where BPL is employed.

If this project is given the green light by the FCC, critical emergency communications will suffer a fatal blow all throughout the United States. All communications between 2 and 80 Mhz will stop.

Please do not allow the BPL experiment to continue.
