

Engineering data supports the basics of how BPL will render the radio spectrum used by our country's Communications First Responders useless.

Here are my feelings about the fact that the local power

companies take years to fix arcing insulators on a pole which cause interference to AM broadcast as well as Amateur bands. How can the same people who do such a poor job of maintaining this basic system be expected to maintain a system needing a higher degree of stability?

There is a horrible potential of interference that can and will be created by using the Electrical power lines to broadcast broadband Internet and other RF information on power lines across the United States of America.

Please count my vote against allowing the use of Electrical power lines for the propagation of Internet broadband information!

Here is my No vote for Power Line RF broadcasting use and approval by the FCC!!
