

Living in rural America BPL would certainly be of benefit. However I am completely opposed to BPL. Even now I am subject to interference from unlicensed consumer electronics on the HF bands. Cordless phones already invade the spectrum both on low HF and satellite areas. One reason I moved to the country was to get away from local interference caused by unlicensed consumer electronics and broadband cable system leakage. Interference created by BPL has been proven to cause impaired abilities for HF stations to communicate effectively. Consider Home Land security should the need ever arise for the Amateur community to response to a nation wide disaster. Abilities to effectively operate will be serious degraded. It appears to me that once again those with deep pockets are using their money to influence government regulators to have things their way with no regards to others. Amateur operators have to constantly fight to persevere the spectrum allocated to them. Technologic advancements are one of this country's greatest assets, however BPL is NOT one of them. Preservation of an interference free HF spectrum must be a priority.
