

I would like to file my strong opposition to BPL.

I live in a small, rural town in South Dakota and we currently have high speed internet through our cable TV company. The technology currently exists to provide broadband to anyone in the US but due to its unprofitability, it's not being used.

It's also my understanding from some of the tests I've seen that RFI would be extreme for all users of the HF spectrum. Why should these licensed users suffer interference due to something that is unnecessary?

If the companies that are pursuing BPL want to provide broadband services to rural/city areas, why not use the technology that's currently available?

Again, as a small town citizen and licensed user of HF spectrum, please do not approve this for the benefit of big companies and the detriment of everyone else.

Thank you.
