

Broadband over powerline must not be allowed to proceed as currently constituted. It is a form of noise pollution that will destroy the ability to listen to foreign shortwave broadcasts, eliminate amateur radio operators' ability to assist with emergency communications, preclude trucker communications on CB which will contribute to highway safety problems and delays in over the road cargo deliveries, and impede high frequency ship to shore and air to ground communications. This menace to high frequency communications must be nipped in the bud before it becomes a massive problem.
