

I have been plagued with power line noise and line noise from various modes of communication for several years, which disrupts my amateur radio communications and renders my receiver useless at times. Radiation from power line communication would only add to this. It is clear to me that such radiation would be intolerable to any amateur radio operator who was trying to operate anywhere near those power lines. Permission to offer high speed data communications over power lines should not be granted by the FCC so long as interference problems remain unsolved.
