

Power companies are the biggest current polluter of our radio spectrum. They do not maintain their existing systems to prevent RFI, allow them to legally use BPL and you will have large portions of the radio spectrum rendered unusable. This would be a disaster to our communications infrastructure. Check your own records from your enforcement bureau and you will see that power companies have little concern for interference to others. I can not imagine why you would be even be considering such a proposal? There are currently plenty of broadband technologies available to the public that do not pollute the spectrum and create interference to others.
