

Broadband over Power Line should not be granted because of insufficient research and evidence on interference to existing services including Amateur radio, commercial Fixed and Mobile Radio, and Public Safety Radio Services.

Also, the power industry has no business getting into the communication business.

Maybe they should concentrate on keeping the power grids up and running and secure rather than open it up to more chances for problems.

They need to stick to maintaining power for the country for economic and national security reasons.

The argument that their stock holders want the opportunity doesn't make sense.

Can't these investors buy stock in the existing communication companies and allow them to develop future communication methods since that is their business.
