

Based upon Americal Radio Relay League interference studies, allowing internet access over power lines (BPL) is not in the best interest on a number of different radio constituancies; military, amateur radio, international broadcasting, international air traffic control, marine radio to name just a few that will be severly impacted by BPL.

With the great wealth of current broadband opportunities, DSL, cable and satellite, it does not make sense to allow a technology that is flawed, prone to interference and creates boradband noise over a wide range of radio spectrum.

I urge the commissioners to table this proposal indefinately.

J C Clark
