

There is no need for a 4th method for gaining high speed internet access. Broadband over powerlines produces interference that is so insidious that it would overpower even the line noise that comes from the power lines! It is already impossible to hear AM radio stations over a 3-mile stretch of Rt. 44 where I live in rural Connecticut. The interference to my Amateur station would be intolerable, and after 28 years of enjoying Amateur Radio and preparing myself and my station I cannot stomach the thought of BPL ruining that. I am quite happy with my dial-up 26.4k Internet access which I am using to file this comment. If I wanted high speed I could use a satellite system.
