

With the growing concern and antiquacity of our existing power grid is it really a wise idea to use it to transmit RF signals that cen cause severe inference to equipment? The recent blackouts in the N.E. USA should be a prime example of just how delicate, and taxed this system is. Adding additional demand to it is not a good idea not to mention the interference it would cause on the general radio spectrum. Our airwaves are alredy being violated and abused by CB radio operator using modified equipment and commercial cell towers and paging systems that over modulate and over diviate their signals. I can no longer watch television without battling for a decent reception. Let's fix what we have and then build anew.
