

Please be aware that the FCC approval of BPL will be to the detriment of amateur radio and other services in the 80 mhz to 150 mhz bands. ARRL tests as well as other International experiences have proven that BPL transmissions place an interfering signal that makes transmissions on these frequencies non readable. Does Michael Powell know that he is leaning in favor of the BPL service that interferes with the amateur radio bands as well as US government services? Does he understand that the emergency services of amateur radio will disappear with the support of BPL? I hope that the FCC petition on BPL will be studied further before there is a rush to approve the service.
