

If Broadband Over Power Line is permitted in this country low power high frequency amateur communications will be impossible in all high population areas and if this service is ever needed again by the public for emergency communications it will not exist. Not many amateurs can afford to purchase a radio that will not work due to constant interference. A constant source of interference like Broadband Over Power Line causes will make future testing of low power high frequency radios nearly impossible so when the need for these systems occurs again they will not be ready and working.
